A designer's dream.

Always innovative, the existing AutoCAD tools for conceptual design and visualisation work with a new toolset to deliver virtually instant productivity. See how quickly AutoCAD 2008 can improve your efficiency with a few tips and tricks from Lynn Allen, Autodesk Technical Evangelist.

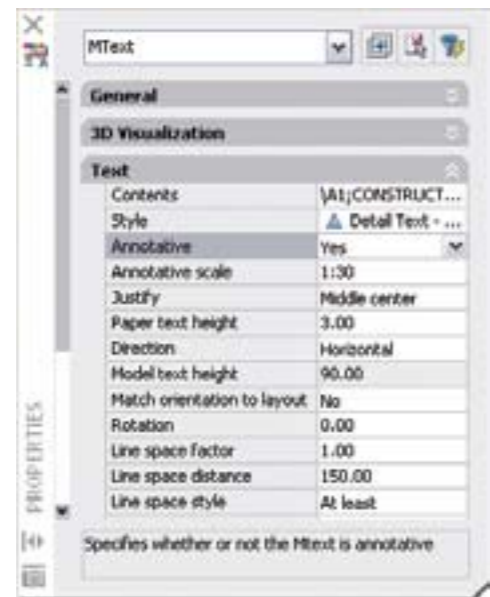

Make efficiency a daily part of the job with AutoCAD 2008 software. The drafting, detailing, and conceptual design standard is leading the way once again. Meticulously refined with the designer in mind, AutoCAD 2008 propels day-to-day drafting forward with features that increase speed and accuracy while saving time.

Annotation scaling and layer properties per viewport minimise workarounds, while text and table enhancements and multiple leaders help deliver an unmatched level of aesthetic precision and professionalism.

Annotation Scaling

If you've found getting the proper scale factors per viewport to be frustrating and confusing, then you'll love the new annotative scaling. No longer will you need to create multiple sets of text and dimensions on multiple layers to get the desired results. The new annotative scaling allows you to create one set of annotative objects (such as text, dimensions, balloons, blocks, attributes and hatches) that displays at the correct size regardless of the viewport scale factor.

After creating text and dimensions with the new "annotative" designation, simply assign each viewport a scale factor from a new control on the status bar. AutoCAD automatically sizes all of your annotative objects to be exactly the size you indicated when they were created. It's that simple. That means you can have the same dimension in multiple viewports that displays at the right size, regardless of varying viewport scale factors.

Layer Properties per Viewport

How many times have you wished you could assign layer properties per viewport? Wish granted. No more tedious duplicating geometry on separate layers and flipping the layers on and off per viewport. Now you can double-click in a viewport and assign a specific colour, linetype, lineweight and plotstyle per layer that affects only the current viewport. Afraid these new settings will add up to too many columns in your Layer dialog box? Don't be – because now you can choose to display just the columns you plan on using. You can even reorganise the columns with a simple drag-and-drop so the ones you use most frequently are displayed toward the left of the dialog box.

Text Enhancements

Life would be so much easier if text would automatically wrap across multiple columns in wide areas of your drawing. Now it does, with the new dynamic columns option in the MTEXT command. Use grips along with the text formatting ruler to get the exact results you're after. The updated MTEXT command also permits more control over paragraph alignment, indentations and spacing. And you can customise the updated Spell Checker for optimal efficiency. And one more tip: now you can create multiline attributes.

You'll find these and other text-related tools in the updated, customisable dashboard along with many more of your favorite 2D drawing commands.

Multiple Leaders

The new MLEADER command permits more control over leaders than ever before. Not only can you control the order of leader creation (head first, tail first, or content first), but you can also add multiple leader lines where needed. Leaders not lining up properly? The new Multileader Align tool snaps leaders into place for you – you can even control the spacing between them.

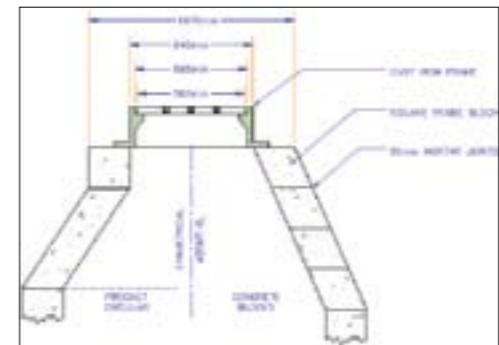

Table Enhancements

Wouldn't it be nice to bring a Microsoft® Excel® file into AutoCAD and truly link the file so when you change the Excel file, it updates in AutoCAD, and vice versa? A nice-to-have has turned into a must-have with the updated Paste Special command. Simply select Paste Link to insert the Excel spreadsheet into AutoCAD. If any changes occur in the XLS file, a bubble notification lets you know the data link has changed and provides an easy option to update the table. So now any changes you make to the AutoCAD table are retained – even if you update the table to reflect changes in the Excel file.
